1894 Markoni pa dice que; an pote balli un info ex an domi ad u recepti-me in un horti, dia spatia e minus plu metalli-fi. Plu 'ami' duce an ad u psychopatho-pe te gene examina !

Some PGN readers may feel discouraged by the seeming slow progress of Glosa. But courage! What we have to overcome is the inertia, the reluctance of the ordinary person to adopt anything new. The history of technology is replete with examples of this frightful conservatism and passivity. It always takes years of work to get a new thing or idea accepted. It has often been said that the actual invention is the easiest part of any innovation. The real difficulties come in the 'selling' of the idea to a passive unreceptive often even hostile public. Unforgivably, the privileged classes who are supposed to receive the best education are just as neophobic.

The education of the future will encourage the student to feel that nothing yet is certain except her own states of consciousness.

One definition of an 'expert'; "It's a tape-recorder, which, on play-back, passes all its examinations, and then is immediately in a position to halt all progress in its field".

Below are a few haphazard examples of neophobia taken from history of science and technology.

Galileo around 1600 constructed a telescope and saw four moons going round Jupiter. This implied that heavenly bodies could go round bigger ones, and went against the church's teaching that the earth was the flat centre of the universe, and sun and moon were there for its convenience. Most contemporary astronomers refused to look through the telescope saying that even if they saw something around Jupiter it would be due to some defect in the telescope.

Anaesthetics. First introduced by Simpson, who used them to ease the pains of child-birth. Opposed by church leaders, who stated that these pains were decreed by God as part of the curse of Eve ! But Queen Victoria didn't share this view and helped to overcome this resistance.

Electromagnetic waves. Existence of these suggested by mathematician Clerk-Maxwell. Hertz proved their existence by sending them from one coil to another in the same room. He was accused of using trickery. Marconi announced in 1894 that he could send a message from his house to a receiver in the garden through space without the use of wires. His 'friends' had him examined in a psychopathic hospital !

Aeroplane. 1903 Wright fratri akti u prima peti. Plu nova journala monstra nulli interesse. U peti ge-vide per tetra andro e mo pueri.

1906 u redakti-pe de u Times grapho que; panto tenta de face u peti-me es; ne solo perilo ad homina bio, sed mu fu assure falliakkorda u dice de plu experta-pe. SED; -

1969 Neil Armstrong landa epi u luna.

1939 pest u morta de Rutherford Hahn pa trova atomi fissio de un Uranium nukleo. An pa este tro phobi de publika u trova; kausa id sic turba plu orthodoxo skienista; sed an ko-ergo-fe Meitner habe ma imagina ne pa este plu tali sympathi, e publika. U-ci pa duce ad u libera de atomi energi e mali-fortuna ad u deino nekro per plu US milita-pe de Hiroshima e Nagasaki....1945. U-ci pa es anti u monito de Hahn e plu hetero ge-civiliza Euro skienista.

Rutherford ne pa pote imagina in u pusi futuri.

Periodic Table of the Chemical Elements. Newlands noticed that if the elements were arranged in order of their atomic weights and in rows of 8 under each other, then the elements in the columns shared many important qualities. When he announced this at the Royal Society Prof. G.F. Foster "humorously enquired whether he had ever examined the elements according to the order of their initial letters".

Actually Newland's discovery was of extreme import, as much later it was discovered that the electrons (whose existence he knew nothing of) circulate round the nucleus of the atom in multiples of 8.

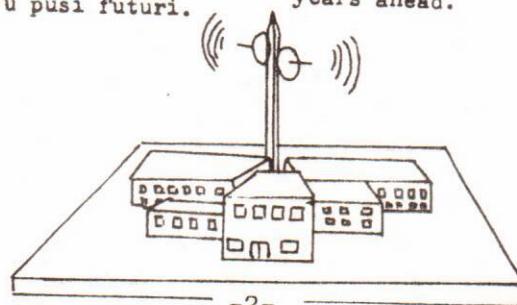

Electric Telegraph. 1861. Francis Renalds offered his invention to the Admiralty, who replied that they had no need for another sort of telegraphy as they already had a system of movable arms on hill-tops. 1921. 60 years later they were offered the steam-turbine, which they turned down as their chief naval designer declared that any ship propelled from behind would be unsteerable.

The Atom. When Thomson stated that the atom was composed of smaller particles (electrons & protons) the suggestion was ridiculed.

1933. Rutherford had helped to show that the rays or particles given off by radioactive substances were of several different kinds...alpha,beta and gamma. Yet in 1933 he stated that the hope of ever getting at the immense amount of energy stored in the atom was all "moonshine". He was also unable to accept Einstein's Relativity. But -

1939. Hahn discovered fission, i.e. the splitting of the Uranium nucleus. He was too frightened to publish because it would 'upset' orthodox physicists, but his partner Meitner, being female, felt no such compunctions and published. This led to the liberation of atomic energy in the first place for the terrible destruction by the US armed forces of Hiroshima and Nagasaki....1945.

Rutherford was totally unable to foresee even a few years ahead.

Tri infra exempla es fo ge-nexi. Panto mu monstra u lento vice de primitivi konfusio per plu mega ma-ordina, ma-haplo systema....alphabeti, numera, Glosa.

Na roga plu lekto-pe de auxi propaga Glosa. Dice de id. Grapho de id ad u loka Pressa. Utili u loka radio.

Grapho a na, questio, kritici.

The next three examples are closely connected. They all show the slow replacement of primitive muddle by much simpler systems....the alphabet, numbers and Glosa.

Earliest written information was preserved by various kinds of pictures. The modern person must be acquainted with at least 50,000 different words. The Chinese have to represent these by various combinations of 4 to 7 thousand logograms, all difficult to remember. The Chinese People's Republic now recognize the Pinyin Romanization of the written language which uses 26 or so letters of the Roman alphabet. This means that the Chinese child has to learn only these 26 characters instead of the four to seven thousand logograms.

There is much opposition to the introduction of Romanization, but the new system is so efficient that it cannot fail to replace the old complexity.

Numbers. Try multiplying XXIV by XVII. This is all the Romans had for their necessarily simple calculations, for which they had to use an abacus. The Hindus invented our present system of numbers hundreds of years BC. They also invented the very important zero, 0, probably long before 400 AD. There was fierce opposition to their use in Europe. Oldest European document using them is dated 976 and was written in Spain.

The Statute of the Arte del Cambio 1299 forbade bankers of Florence to use the Hindu numerals. Sometime during the 14 century Italian merchants began to use them in account books; but the Roman numerals were not abandoned until 1482. The earliest use of the Hindu numbers in Britain is in a rent-roll in 1490. What a waste of time!

The Hindu numbers enable little children to do computations in their head utterly beyond the capabilities of the greatest minds of the past.

Language.

Number of languages used verbally	c. 3,500
Number of writable languages	c. 500
Number of African languages	1,250
Number of European languages	28
South Asian languages	23
USSR	89
Indian languages and dialects	1,650
Indian languages for official & education	15
Ghana	56
Mexican Indians	200+

From the UNESCO book "Many Voices, One World"; "The world-wide use of a small number of languages leads to a certain discrimination against the others. Actually only a tiny élite in the Third World ever to speak one of these few informatively. "...the diffusion of one simple, universal tongue, comprehensible and accessible to all, would quickly demolish the barriers to communication between different peoples."

NOW GLOSA

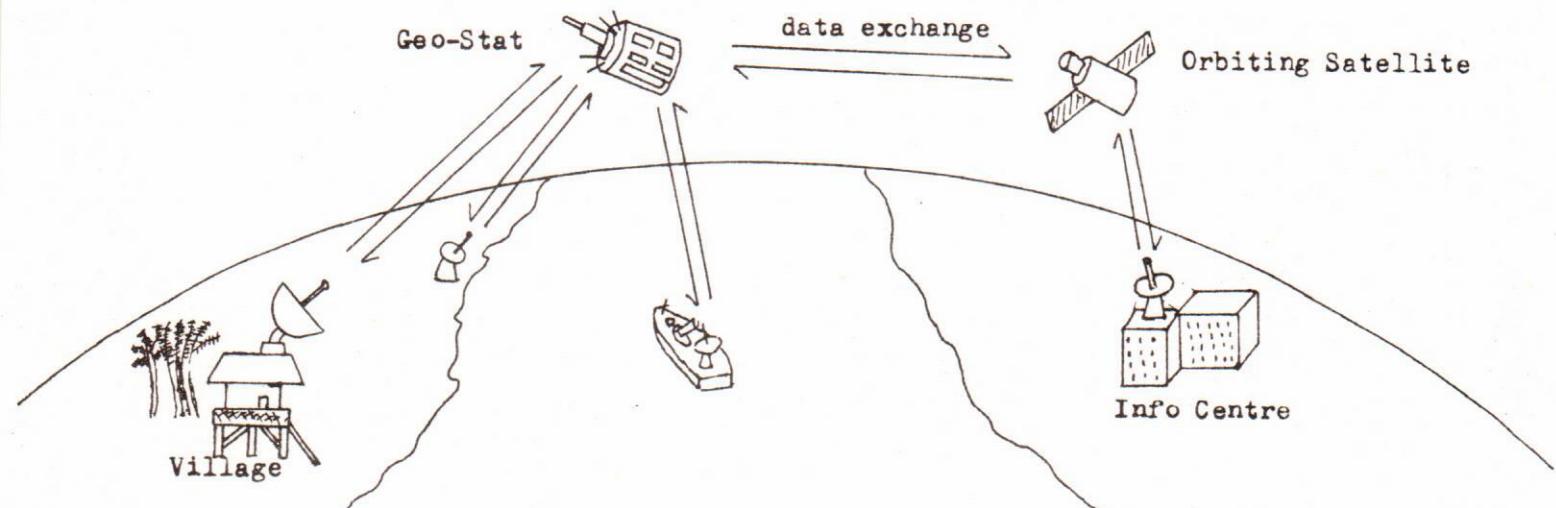

Of course there are countless thousands of historical and present-day examples of Neophobia. About Glosa. We believe we are more fortunate. The time is ripe. The Global Communications Network demands it. The necessity for dialogue between intelligent ordinary people everywhere on the Earth demands it. And the absurd waste of time and money on the confusion of languages in the EEC and UN demands it.

We ask readers to help us propagate Glosa. Talk about it. Write about it to the local Press. Get on the local Radio.

Write to us, questioning, criticizing.

THE HISTORY BEHIND GLOSA

- 1662** Royal Society was founded. Almost immediately encourages attempts to invent an international language to replace Latin whose international use had been much weakened by the rise of European nationalism. Many proposals were suggested but all too complicated. Latin had been used successfully as the international medium throughout Europe amongst learned people almost up to 1700. Newton's 'Principia' was published in Latin and was not translated into English until 1729.
- 1700** Leibnitz (who invented the Calculus) was very interested in the question. He was the first to point out publicly that the complex grammar of Latin was totally unnecessary, and could be easily replaced by a few particles (little words). The grammar of all primitive languages gets over-complicated and Civilization leads to a slow gradual simplification, much hastened by war, invasion and revolution.
- 1905** Prof. Peano (Italian mathematician) published a dictionary of Latino sine Flexione (Latin without inflexions). He used the language at scientific conferences, starting with conventional Latin and gradually omitting the grammatical devices. He made no attempt to work out the minimum vocabulary as the language was intended only for European use. However, he followed Leibnitz in cutting out the grammar.
- 1932** Basic English was put forward by Ogden and Richards as an International Language. They did get the vocabulary reduced to a mere 850 words, but, the price was the use of great numbers of difficult idioms. Easy for English speakers but very difficult for foreigners. On the other hand they did introduce some useful ideas of word-economy.
- 1943** Interglossa published by Prof. Hogben (Biologist and linguist). Other publications... Mathematics for the Million, Science for the Citizen, The Mother Tongue and edited The Loom of Language. Hogben fully recognized that grammar is unnecessary and time-wasting, but pointed out that since Peano vast numbers of Greek words are being exclusively used by scientists in making their terminology, and that these same Greek words quickly enter the vernacular; words like ARTHRItis(joint-pain), CARDIAc(heart); plant names, electronic terms. Hogben listed 880 words which easily suffice for any but the most specialized talk. IG failed to attract the interest it deserved for two reasons; 1/ It was published during the war, when peoples attention was otherwise engaged; and 2/ he wrote it for linguists and teachers of language instead of for the ordinary non-linguist, the very person who would most benefit from its universal adoption.
- 1978** Ashby and Clark, the present authors, who had long seen the potential of IG received Hogben's blessing to take up the task of its propagation. After Hogben's death, and after much translation into IG, and some feed-back from interested linguists, it was felt advisable to introduce a few superficial modifications mostly affecting the final vowel (all IG words end with a vowel for ease of pronunciation). As Hogben was no longer available to approve these changes it was thought fitting to change the name to GLOSA.
- Published 1100-word list on Glossy A3 cards in Eng-Glosa and French-Glosa in red Glosa and black English and French.
Designed the Glosa symbol

- 1981** Published Tetralingual Dictionary. 5000 Greek and Latin words and roots which occur in the Euro- and scientific vocabularies; into English, French and German.
 Published 2200 Eng-Glosa and Glosa-Eng Dictionary.
 First issue of the Glosa News Letter, PGN (Plu Glosa Nota).
 Had the first Glosa meetings at Hampstead, in N.W.London at which it was confirmed the average person can master the important Mechanics of Glosa in an hour and can then write on any theme with the help of the Dictionary.
 Pen-friends start exchanging letters in Glosa.
- 1982** Published 500-word list Eng-Glosa on one A4
 1800-word Basic Dictionary Eng-Glosa and Glosa-Eng.
 3000-word German -Glosa Dictionary.
- 1983** Published Glosa 1000. Complete Central Vocabulary with Mechanics on one A4 sheet.
 French 2000 into Glosa 1000 Dictionary.
 Glosa 2000 -Spanish Dictionary
 Glosa 6000-English Dictionary, the most popular one so far.
 Sporta-Glosa 1000 Puzzle-book.
 2nd Edition Basic Dictionary Eng-Glosa and Glosa-Eng.
- 1984** Glosa 5000 advanced. Lists 5000 of the lesser familiar Greek and Latin roots.
 Glosa 1000 with etymological Mnemotechnic Notes + 5000 Eng commoner words defined by Glosa 1000.
 Glosa 1000-French on one A4
 Glosa 1000-German on one A4.
- 1985** March 2nd enlarged and improved edition of Glosa 6000.
 April Glosa work-book for teachers of Glosa and home learners who like exercises.
 There are now 3 Dictionaries, Basic, Intermediate and Advanced. The concentration now will be on publicity, articles in magazines, talks, discussions, contacting international and educational organizations.
 Prepare to participate in International Peace Year, 1986.

AIMS OF GLOSA

Glosa simplifies, improves, and economizes international communication.
 It is as easy to learn for a Third World as for a European worker.
 It provides a common auxiliary language for scientists, technicians, computers, and View-Data. For tourists and eventually for the EEC and the United Nations.
 It has great educational uses as it gives meaning to the millions of scientific and Technical terms that scientific and medical and biological students now have to memorize.

THE GLOSA SYMBOL

The Glosa symbol represents the Global Web or Network of electronic communications, Telephones, Radio, T.V., Satellites, These marvels are frustrated by the anachronistic survival of thousands of languages.

The nodes represent the various communication devices; the inner circle the Central Glosa 1000 Vocabulary; the outer circle stands for the much larger backing Vocabulary embracing all the Greek and Latin words and roots used in sci-tech Terminology, and in the learned vocabularies of the European languages.

Open at top showing that Glosa must never be closed to new ideas. 2 antennae probe Space; radii represent the numerous spin-offs.

Central Greek letter PSY stands for the human PSYche controlling, not controlled.

PLU GRAMA

...esque OVIS ALIMENTA semane The sheep is eating
or The sheep's food. ?

... pluso, Plu Glosa verba habe poly semane; exempla,
mu pote es nyma(noun), klavi-verba(verb), auxi-verba.
(auxiliary verba).

S, Pidd,
York.

ALIMENTA means 'food'. The ALIMENTARY canal is the food-canal; and ALIMENTATION is a welcome and conspicuous sign in any French store.

The sheep is eating UN OVIS NU VORA.
The sheep's food UN OVIS ALIMENTA
or UN ALIMENTA DE OVIS.

Each Glosa word has only one meaning, stands for only one concept. There are no parts of speech. This is same as in Chinese and increasingly in English. If you listen carefully to what people actually say in the course of daily routine you will find it's context which conveys meaning

Shakespeare never bothered about parts of speech. In his 'but me no buts' he's using a conjunction as verb first, then as noun!

No Glosa word is invented. All Glosa words exist in classical Greek and Latin. Indeed, anybody who knows the Glosa Dictionaries will be able to work their way through a classical Latin text; and, since Modern Greek is almost the same as Ancient Greek, will understand much of the former.

The only difference is that Glosa gets rid of the useless grammatical endings.

If you suffered Latin grammar at school you will remember with pain and disgust that the verb AMAre, to love is conjugated as follows; present tense only;

AMO	I love	AMAMUS	we love
AMAS	thou lovest	AMATIS	you love
AMAT	he,she,it loves	AMANT	they love.

In Glosa this becomes; AM- is the root

MI AMO	NA AMO
TU AMO	VI AMO
AN,FE, ID AMO	MU AMO.

The language of science has grown naturally. It is a far richer language than that of the non-scientists because it has to describe and name a myriad micro- and macro-structures of breath-taking beauty and complexity. The marvellously successful Botanical Latin is practically an artificial language. It is known in which direction 'natural' languages are developing, so Glosa simply jumps ahead.

And remember! Every Glosa word occurs in English. English is an isolating language...so is Glosa. Because it has been found impossible to teach good informative English to the ordinary people of the Third world owing to lack of the right sort of teachers and motivation amongst the students, Prof. Quirk and his associates are backing what they call Nuclear English, a much simplified slangy sort. We know that Glosa is far better, based as it is in the classics and is in daily lively use in the world of learning.

English has 42 consonant sounds spelt in 658 different ways; it has 19 vowel sounds spelt in 250 different ways. That little fact alone makes English impossible as a candidate for a world language. Glosa is practically phonetic, with only 5 vowel sounds as in Spanish and 19 consonant sounds spelt in 21 ways...f & ph are same; and t and th.

GLOSA 6000

6000 Greek & Latin words and roots which occur in the Euro-languages and international scientific terminology.

Second edition, revised. A5, 116 pages, spiral. ISBN 0 946540 08 X
Publication date March 18th. 1985.

Net price £4.80 (+ 50p postage in U.K.)
(+ 70p Surface to USA)

Authors; Wendy Ashby & Ronald Clark.

Contents; From Classical Greek & Latin to Glosa; Brief History of International Latin; Greek & Latin are Euro-familiar; Botanical Latin; 6000 word list Glosa-English; Greek and Latin affixes;

The Need for an International Language; The Royal Society; Interglossa Brings in Greek; Glosa, Advantages of Glosa; Mechanics of Glosa; Parallel Text; Glosa 1000 - the Central Vocabulary with mnemotechnic notes.

This book is suitable for educationalists, students, linguists and for Glosa enthusiasts.
